TITLE: Comparative study of the immunity of formic acid and smallpox antibodies against the virus of smallpox in mice. (Russian)

SOURCE: AN ArmeSSR. Izvestiya. Biologicheskiye nauki, v. 17, no. 11, 1964, 69-73

TOPIC: experiment animal, immunology, radiology, x ray irradiation, virus disease, virology, blood, drug, sensitivity

Abstract: The synthesis of antibodies against the virus of smallpox and the serum of mice were studied. The authors conclude that the antibodies of the serum of mice are more effective than those of the blood of man.

hodies are primarily associated with the gamma-globulin fraction of the serum proteins. Systematic administration of colamine in the period of immunological rearrangement stimulates the formation of anti smallpox antibodies in irradiated and non-irradiated hamsters. Title : Production and Storage of Grape Juice.  
Orig Pub : Gradina, via si livada, 1957, 6, No 19, 27-30

Abstract : Description of composition, properties and therapeutic action of grape juice. For preservation it is recommended to pasteurize (for 30 minutes at 65-70° or 15 minutes at 75-80°) the filtered juice, or to store it either at 2-3° or under CO<sub>2</sub> pressure (7-8 atmospheres), and bottle the juice several months later. Small amounts of juice are bottled immediately after pasteurizing and subjected to sterilization thereafter (30 minutes, 70-75°).

Biscuits and Candy.

Orig Pub: Standardizarea, 1958, 10, No 8, 379-381, 415-416.

Abstract: Ten ml. of distilled water are added to 3 g. of  
the article (for biscuits, this operation is  
omitted); the mixture is stirred well and, after  
the addition of 20 ml. of ether, is shaken for 30  
minutes and centrifuged for 5-10 minutes (in the  
case of biscuits, if the ether is not transpar-  
ent, 3-4 ml. of water are added and again cen-  
trifuged for 3-4 minutes). Ten ml. of the ether

AUTHOR: Varunov, K.F., Engineer

TITLE: The Installation of a Vertical Drainage  
from Porous Concrete (Ustroystvo vertikal'-  
nogo drenazha iz poristogo betona)

PERIODICAL: Gidrotekhnicheskoye stroitel'stvo, 1959,  
Nr 2, p 22-25 (USSR)

ABSTRACT: The author describes the use of tubular  
filtering blocks, made from porous concrete,  
during the construction of the Stalingrad  
Hydro-Electric Power Plant. These blocks were  
prepared from sifted crumbled stones with the  
aluminous cement of the 400 mark (75 cm long,  
external diameter - 35 cm, internal diameter -  
15 cm). Each block was tested for filtration.  
The filtration coefficient was determined ac-  
cording to the formula elaborated by P.A.

Card 1/3

SOV/98-59-2-5/22

The Installation of a Vertical Drainage  
from Porous Concrete

Kulakov:

$$K = \frac{Q}{0,47H(1+5H)}$$

where Q - is the amount of the water filtering through the walls in cu m in 24 hours, and H - is the height of the water column inside the block. A determined amount of water (294 cu m in 24 hours) was then poured into the block. If, at the end of the experiment, the height of the water column did not exceed 50 cm, the block was good for use because its filtration coefficient (according to the formula) would be more than 350 m in 24 hours.

Card 2/3

14(10)

SOV/98-59-2-5/22

The Installation of a Vertical Drainage  
from Porous Concrete

After drilling the hole not less than 2 m deep, the tubular blocks were placed inside the drive-pipe and held together with a felt padding impregnated with dissolved bitumen. After the drive pipes were extracted, the empty space was filled with coarse-grained sand. The interior of the blocks was then washed with a powerful ejector pump and after that the inside was filled with gravel. There are 2 diagrams, 1 photo, 1 graph and 1 table.

TITLE:

The heat of formation of the n-butyl ester of di-n-butyl boric acid

PERIODICAL:

Zhurnal obshchey khimii, v. 32, no. 1, 1962, 284-287

TEXT: The authors determined the standard heat of combustion of di-n-butyl boric acid and of the n-butyl ester and its heat of formation, based on the value of the heat of formation of  $B_2O_3$ , published recently in Western literature.  $(\underline{n}\text{-Bu})_2B\text{-On-Bu}$  was obtained by a method previously described by the authors. Calorimetric tests were carried out with  $\sim 0.4$  g of the substance, under 25 atm. of  $O_2$ . Full experimental details are given, as well as the methods used for determining the combustion products. Some side reactions take place. The authors introduced corrections to their results, based on the following assumptions: a) The tiny black spots of incomplete

The heat of formation of the ...

combustion consist of  $B_4C$  and C; b)  $B_2O_3$  is hydrated during the main combustion process to boric acid; c)  $H_2O$  formed during combustion is used partly in the hydration process and partly to form a saturated solution of boric acid. d) The small amount of water (0.9 g) introduced into the calorimeter before combustion in some experiments does not take part in the solution process. The experimental results are given in a table and it is seen that with the above corrections the results are the same with added water as in its absence. The heat of formation of traces of  $HNO_3$ , heats of hy-

dration and solution and those of incomplete combustion were allowed for. It has been found that the heat of combustion of the ester was equal to  $-2040.7 \pm 1$  Kcal/mol under conditions of the combustion experiment, and to  $-2045.7 \pm 1$  Kcal/mol under standard conditions. The heat of formation of the ester was calculated as  $-156.1 \pm 3$  Kcal/mole. There are 1 table and 12 references: 5 Soviet-bloc and 7 non-Soviet-bloc. The 4 most recent references to the English-language publications read as follows: E.J. Prosen, W.H. Johnston and F.Y. Pergiel, J. Res. Natl. Bur. Stand., 62, 43, 1959; D. Smith,

TITLE: Heats of combustion of trialkylborons. II. Derivation of equation for calculation of the heats of combustion of trialkylborons

SOURCE: Zhurnal fizicheskoy khimii, v. 38, no. 6, 1964, 1474-1480

TOPIC TAGS: trialkylboron, heat of combustion, heat of hydroboration, thermodynamics, calorimetry

ABSTRACT: In recent years the heats of formation of a large number of trialkylborons have been experimentally determined. The determinations were conducted by the heat of combustion method and by measuring the heat of the reaction of hydroboration of olefins with formation of the corresponding trialkylborons. The purpose of this work was to verify the agreement of these experimental results and to generalize them for calculation of the heats of combustion or formation for those trialkylborons which were not investigated experimentally. The authors derive a general form equation for calculation of the heat of combustion of trialkylborons according to the method of V. M. Tatevskiy [Khimicheskoye stroyeniye uglevodorodov

ACCESSION NR: AP4041752

1 zakonomernosti v ikh fiziko-khimicheskikh svoystvakh (Chemical Structure of Hydrocarbons and Their Characteristic Physico-Chemical Properties), Moscow State University Press, 1953]. The obtained equation was used for verifying the agreement between the available data on the heats of combustion of trialkylborons. It was found that there exists a systematic discrepancy of several kcal/mole between the data obtained by the heats of combustion method and those calculated from the determination of the heats of hydroboration of olefins. The authors express their gratitude to S. S. Yarov for a number of valuable suggestions in the preparation of this manuscript. Orig. art. has: 5 tables.

AUTHOR: Varvak, P. M. and Varvak, A. P.

TITLE: Momentless shallow rectangular shells of equal resistance (in x- and y-directions)

SOURCE: AN UkrSSR. Dopovidi, no. 8, 1963, 1021-1025

TOPIC TAGS: momentless shell, shallow shell, membrane deflection, finite difference method

ABSTRACT: The problem of a momentless shallow rectangular shell-membrane without bending was considered. The shell is described by equation (1)

$$S_x \frac{\partial^2 z}{\partial x^2} + 2T_{xy} \frac{\partial^2 z}{\partial x \partial y} + S_y \frac{\partial^2 z}{\partial y^2} = -q \sqrt{1 + \left(\frac{\partial z}{\partial x}\right)^2 + \left(\frac{\partial z}{\partial y}\right)^2}. \quad (1)$$

where S is a resistance. The shell was assumed to be so shallow that the right-hand side of equation (1) was equal to -q. The assumption was made [after G. S. Card 1/2

ACCESSION NR: AP3006954

Ramaswamy, Civil Engng. and Public Works Rev., 53, 626, 899 (1958) / that  $T_{xy} = 0$ ;  
 $S_x = S_y = S = \text{const}$ , so that equation (1) could be approximated by Poisson's  
equation

$$\frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial y^2} = -\frac{q}{S}. \quad (2)$$

The method of finite differences was applied in the solution. Tables for  
certain loads are given to find the corresponding shell profile and to calculate  
the reactions. Orig. art. has 5 numbered equations, 4 tables and 5 figures.

SOURCE: AN UkrRSR. Dopovidi, no. 5, 1964, 586-588

TOPIC TAGS: shallow shell, zero-moment shallow shell, circular membrane, stress distribution

ABSTRACT: This is an extension of two earlier papers by the authors [DAN UkrRSR, 1025 (1964); DAN UkrRSR, 47 (1964)] which is applicable to the problem of a curvilinear-shaped shell without bending and of equal resistance. The treatment is according to the method of finite differences in polar coordinates. Stress distributions are given in tabular form for circular, semi-circular, and quarter circular (wedge-shaped) shapes. Orig. art. has 7 numbered equations, 3 tables and 5 illustrations.

TITLE: Calculation for rectangular slabs under the action of edge moments

SOURCE: Prikladnaya mekhanika, v. 1, no. 12, 1965, 127-131

TOPIC TAGS: elastic plate, bending stress, boundary condition

ABSTRACT: It is shown that the engineering analysis of deflection of rectangular plates under edge moments can be carried out by the aid of tables listing plate-bending magnitudes and force factors  $a_{km} = 1$  under uniform or concentrated loads. The method can be applied in a straightforward way to supported slabs, for example, by substituting the edge moments with a pair of forces with a moment equal to the given moment  $M_x$ . This is shown schematically on Figures 1 and 2. The analysis for

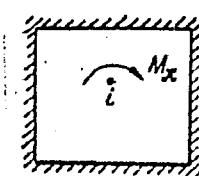

Fig. 1

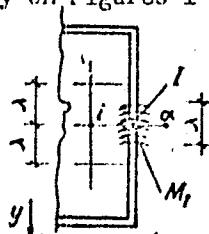

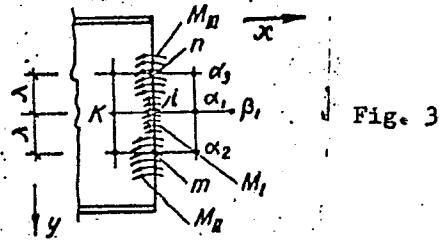

Fig. 2

Card 1/3

L 13370-66

ACC NR: AP6002345

free-boundary slabs is somewhat more complicated. Using Fig. 3 expressions can be

derived for the slab bending

$$w_{\alpha_1} = \dots + \frac{M_I \lambda^2}{D}$$

$$w_{\alpha_2} = \dots + \frac{M_{II} \lambda^2}{D}; \quad w_{\alpha_3} = \dots + \frac{M_{III} \lambda^2}{D}$$

and

$$w_{\beta_1} = \dots + 2(3-\mu) \frac{M_I \lambda^2}{D} + (2-\mu)(M_{II} + M_{III}) \frac{\lambda^2}{D}$$

whose values can be calculated from tables published by P. M. Varvak, I. O. Guberman,

In terms of the stress function  $\psi$ , the boundary conditions are given by the values of the second derivatives of the displacement function  $u$ . The use of the second derivatives of stress in terms of the derivatives of the displacement must be replaced by difference equations on a discrete point lattice. Boundary conditions are discussed in it is evident that the role of the stress function is to reduce the number of degrees of freedom in the resulting system of equations. The boundary conditions are given by the following relations:
